

Pastoralism on the Tibetan Plateau

Summary/Zusammenfassung

My interest in research is about the global change and diversity on the Tibetan Plateau in social and environmental contexts. The Tibetan Plateau is one of the key strategically important areas of global change and diversity. I engage in qualitative fieldwork research and normative analysis intertwining with observational information, theoretical frame, and statistical analysis to present contemporary socio-economic issues as well as dynamic changes in the ecosystem.

I apply interdisciplinary approaches to engage research that is built on the existing excellence in remote sensing, biodiversity ecosystem functioning research, soil science, evolution, physics, and statistics. My research aims to address the social and environmental issues in Tibetan plateau as a component of the broader aspect of global change and diversity, recommending sustainable development for the people and ecosystem of the Tibetan Plateau.

My research interests lie in the social and environmental contexts of global change and diversity on the Tibetan Plateau. The Tibetan Plateau is one of the key strategically important areas of global change and diversity. This research is supported by the University of Zurich Research and Priority Programme on Global Change and Biodiversity (URPP-GCB).
